

Appendix L: Results from the CPT-Recommended Model Scenario

William T. Stockhausen
Alaska Fisheries Science Center
15 September 2018

THIS INFORMATION IS DISTRIBUTED SOLELY FOR THE PURPOSE OF PREDISSEMINATION PEER REVIEW UNDER APPLICABLE INFORMATION QUALITY GUIDELINES. IT HAS NOT BEEN FORMALLY DISSEMINATED BY NOAA FISHERIES/ALASKA FISHERIES SCIENCE CENTER AND SHOULD NOT BE CONSTRUED TO REPRESENT ANY AGENCY DETERMINATION OR POLICY

Introduction

The CPT rejected all “18” model scenarios put forward by the assessment author. These scenarios were based on revised fishery data which had a substantial impact on estimates of survey catchability and, as a consequence, stock biomass levels. Given the substantial impact the change in data had, the CPT rejected the scenarios based on the revised data because the mechanisms for changes in the results were not fully understood and the data had not been previously reviewed and vetted by the CPT. Consequently, the CPT requested that the assessment author run the 2017 assessment model (17AM) using the data used in that assessment but updated with only the new data for 2017/18 (NMFS survey, retained catch biomass and size compositions from the directed fishery, and total catch biomass and size compositions from the directed fishery and bycatch fisheries). The assessment author was able to comply with this request to the extent of providing results for the maximum likelihood solution; MCMC results for the model scenario were not possible given the time constraints. This model scenario was designated 18AM17. A subset of results from this model scenario are presented in this appendix.

Management performance

Historical status and catch specifications for eastern Bering Sea Tanner crab from the CPT-recommended model scenario 18AM17.

(a) in 1000's t.

Year	MSST	Biomass (MMB)	TAC (East + West)	Retained Catch	Total Catch Mortality	OFL	ABC
2014/15	13.40	71.57 ^A	6.85	6.16	9.16	31.48	25.18
2015/16	12.82	73.93 ^A	8.92	8.91	11.38	27.19	21.75
2016/17	14.58	77.96 ^A	0.00	0.00	1.14	25.61	20.49
2017/18	15.15 ^C	64.09 ^A	1.13	1.13	2.39 ^C	25.42	20.33
2018/19		35.95 ^{B,C}				20.87 ^C	16.70 ^C

(b) in millions lbs.

Year	MSST	Biomass (MMB)	TAC (East + West)	Retained Catch	Total Catch Mortality	OFL	ABC
2014/15	29.53	157.78 ^A	15.10	13.58	20.19	69.40	55.51
2015/16	28.27	162.99 ^A	19.67	19.64	25.09	59.94	47.95
2016/17	32.15	171.87 ^A	0.00	0.00	2.52	56.46	45.17

2017/18	33.39 ^C	141.29 ^A	2.50	2.50	5.27 ^C	56.03	44.83
2018/19		79.26 ^{B,C}				46.01 ^C	36.81 ^C

A—Estimated at time of mating for the year concerned. This is a revised estimate, based on the subsequent assessment.

B—Projected biomass from the current stock assessment. This value will be updated next year.

C—Based on the CPT's recommended model scenario (Scenario 1817AM).

Basis for the OFL

a) in 1000's t.

Year	Tier ^A	B _{MSY} ^A	Current MMB ^A	B/B _{MSY} ^A	F _{OFL} ^A (yr ⁻¹)	Years to define B _{MSY} ^A	Natural Mortality ^{A,B} (yr ⁻¹)

b) in millions lbs.

Year	Tier ^A	B _{MSY} ^A	Current MMB ^A	B/B _{MSY} ^A	F _{OFL} ^A (yr ⁻¹)	Years to define B _{MSY} ^A	Natural Mortality ^{A,B} (yr ⁻¹)
2014/15	3a	65.74	140.66	2.14	0.61	1982-2014	0.23
2015/16	3a	59.06	118.38	2.00	0.58	1982-2015	0.23
2016/17	3a	56.54	99.95	1.77	0.79	1982-2016	0.23
2017/18	3a	64.30		2.12	0.75	1982-2017	0.23
2018/19	3a	66.78	79.26	1.08	0.74	1982-2018	0.23

A—Calculated from the assessment reviewed by the Crab Plan Team in 20XX of 20XX/(XX+1) or based on the CPT's recommended model for 2018/19.

B—Nominal rate of natural mortality. Actual rates used in the assessment are estimated and may be different.

Current male spawning stock biomass (MMB), as projected for 2018/19, is estimated at 35.95 thousand t. B_{MSY} for this stock is calculated to be 30.29 thousand t, so MSST is 15.15 thousand t. Because current MMB > MSST, **the stock is not overfished**. Total catch mortality (retained + discard mortality in all fisheries, using a discard mortality rate of 0.321 for pot gear and 0.8 for trawl gear) in 2017/18 was 2.39 thousand t, which was less than the OFL for 2016/17 (25.42 thousand t); consequently **overfishing did not occur**. The OFL for 2018/19 based on the CPT's recommended scenario (Scenario 18AM17) is 20.87 thousand t. Because there was not time to make MCMC runs, the P* ABC could not be evaluated and thus maxABC could not be determined. In 2014, the SSC adopted a 20% buffer to calculate ABC for Tanner crab to incorporate concerns regarding model uncertainty for this stock. Based on this buffer, the ABC would be 16.70 thousand t.

Tables and Figures

Selected tables and figures from the original assessment have been updated below for the CPT's recommended scenario 18AM17. The table and figure numbers below do not correspond to those in the original assessment.

List of Table Captions

Table 1. Comparison of fits to mature survey biomass by sex (in 1000's t) from the 2017 assessment model (17AM) and the CPT's recommended scenario (18AM17).....	6
Table 2. Comparison of estimates of mature biomass-at-mating by sex (in 1000's t) from the 2017 assessment model (17AM) and the CPT's recommended scenario (18AM17).....	7
Table 3. Estimated population size (millions) for females on July 1 of year. from the CPT's recommended scenario (18AM17).	8
Table 4. Estimated population size (millions) for males on July 1 of year. from the CPT's recommended scenario (18AM17).	8
Table 5. Comparison of estimates of recruitment (in millions) from the 2017 assessment model (17AM) and the CPT's recommended scenario (18AM17).....	9
Table 6. Comparison of exploitation rates (i.e., catch divided by biomass) from the 2017 assessment model 17AM) and the CPT's recommended scenario (18AM17).	10
Table 7. Values required to determine Tier level and OFL for selected model scenarios. These values are presented only to illustrate the effect of incremental changes in the model scenarios. Results from the CPT's recommended model (18AM17) are highlighted in green. Note: the 2017/18 MMB is for July 1, 2018, not at the time of mating.	11

Table 7. Values required to determine Tier level and OFL for selected model scenarios. These values are presented only to illustrate the effect of incremental changes in the model scenarios. Results from the CPT's recommended model (18AM17) are highlighted in green. Note: the 2017/18 MMB is for July 1, 2018, not at the time of mating.

Figures

Population Quantities

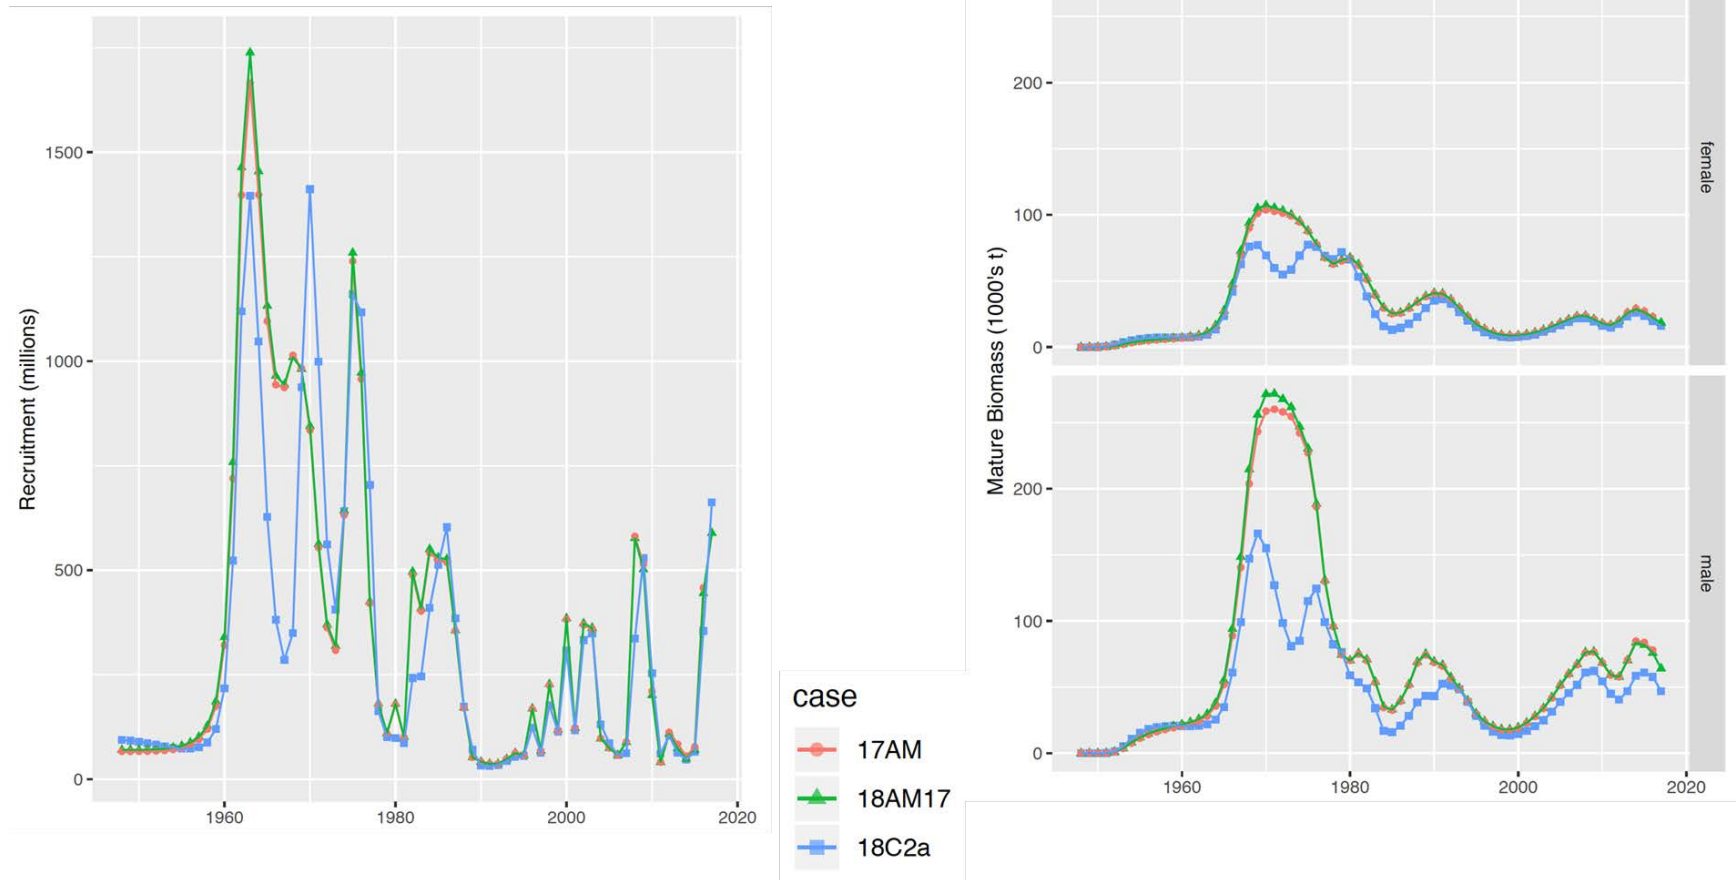

Figure 1. Comparison of estimated population quantities from the CPT's recommended scenario (18AM17), the 2017 assessment model (17AM), and the author's preferred scenario (18C2a).

Population Quantities: Biomass (1000's t)

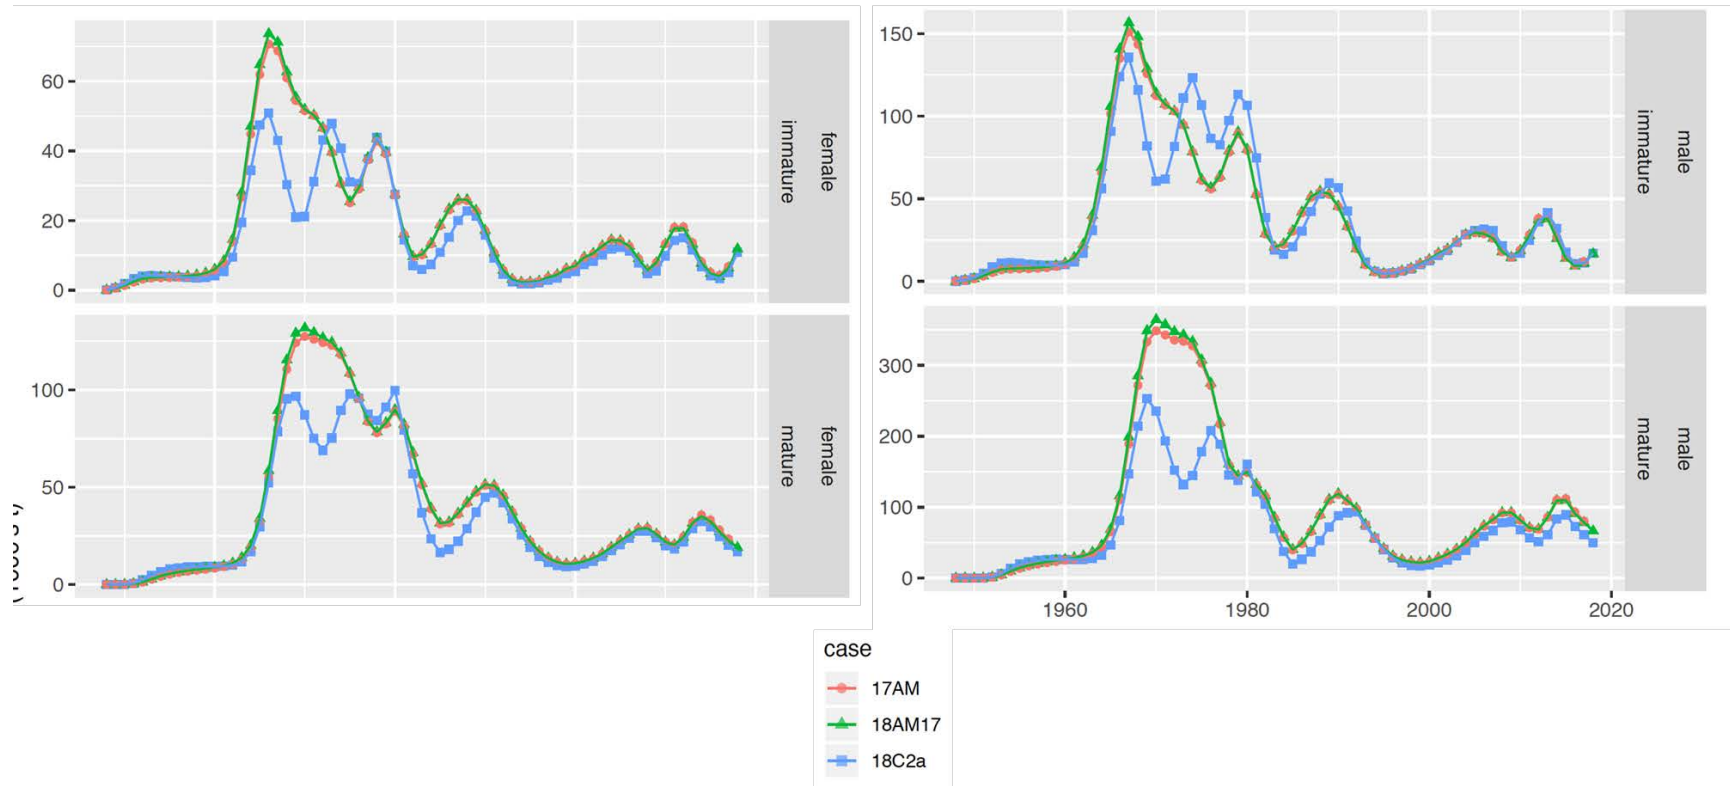

Figure 2. Comparison of estimated population quantities from the CPT's recommended scenario (18AM17), the 2017 assessment model (17AM), and the author's preferred scenario (18C2a).

Population processes

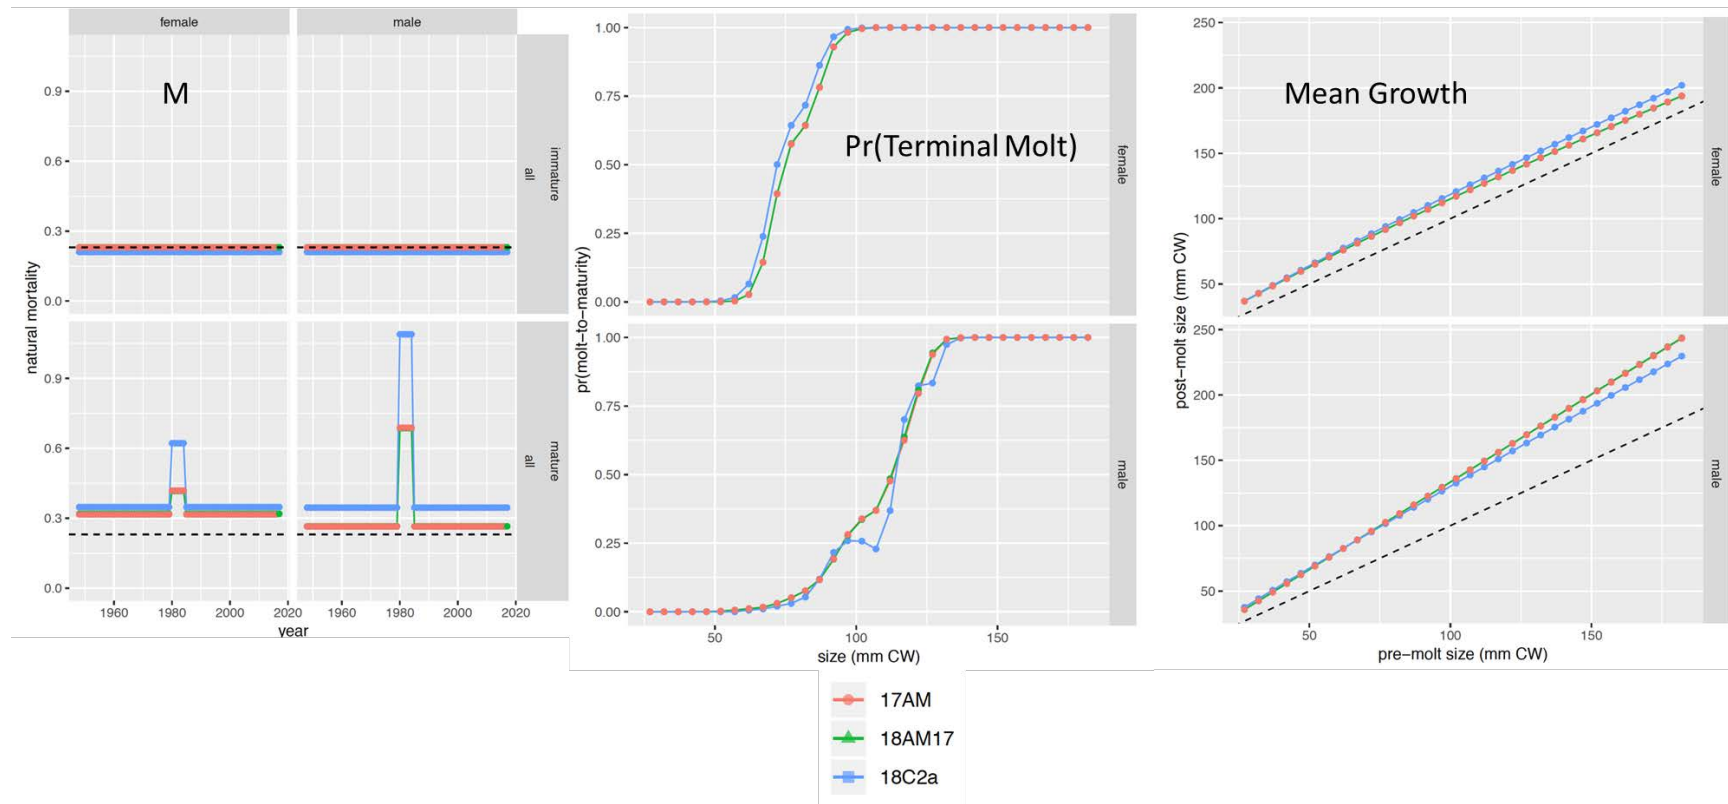

Figure 3. Comparison of estimated population processes from the CPT's recommended scenario (18AM17), the 2017 assessment model (17AM), and the author's preferred scenario (18C2a).

Survey Characteristics

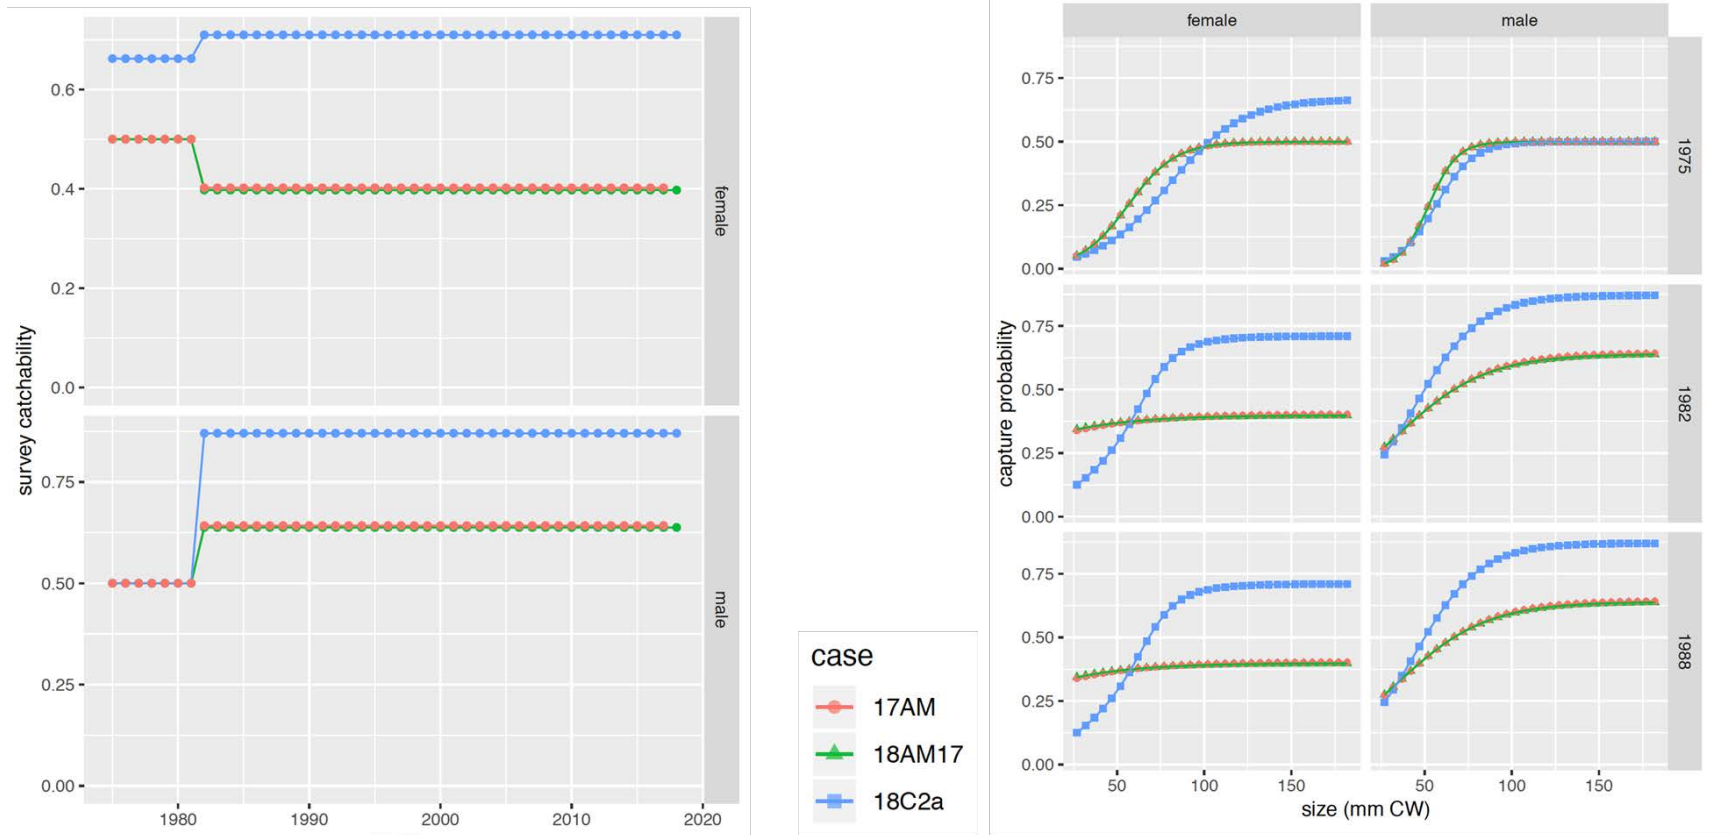

Figure 4. Comparison of estimated survey characteristics from the CPT's recommended scenario (18AM17), the 2017 assessment model (17AM), and the author's preferred scenario (18C2a).

Fishery Catchability

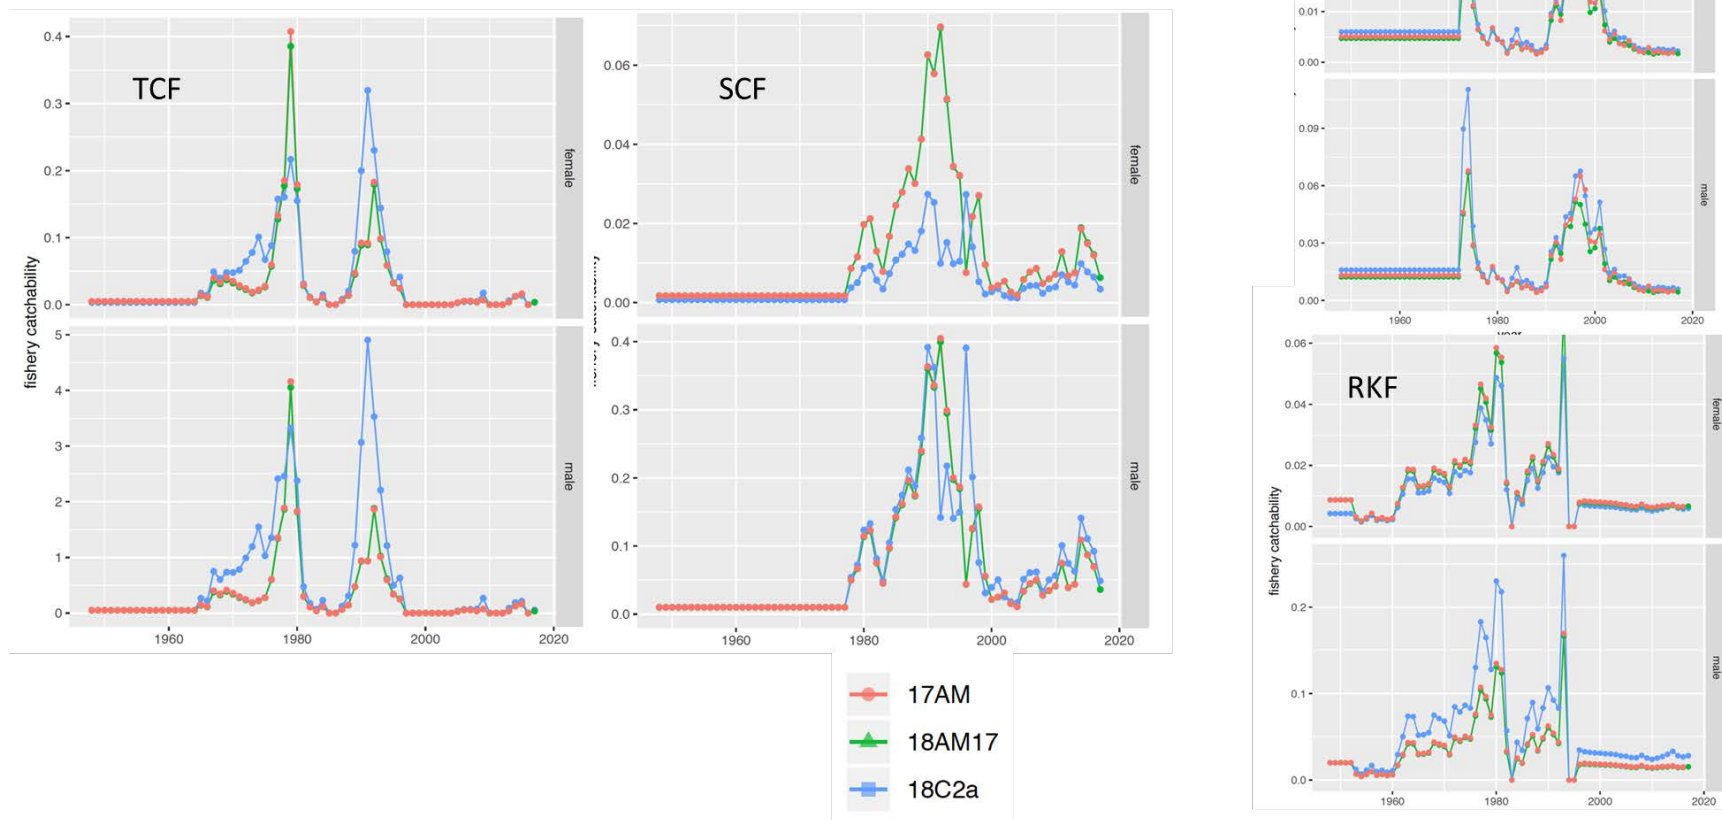

Figure 5. Comparison of estimated fully-selected catchability in the directed and bycatch fisheries from the CPT's recommended scenario (18AM17), the 2017 assessment model (17AM), and the author's preferred scenario (18C2a).

Fishery Total Catch Selectivity: TCF

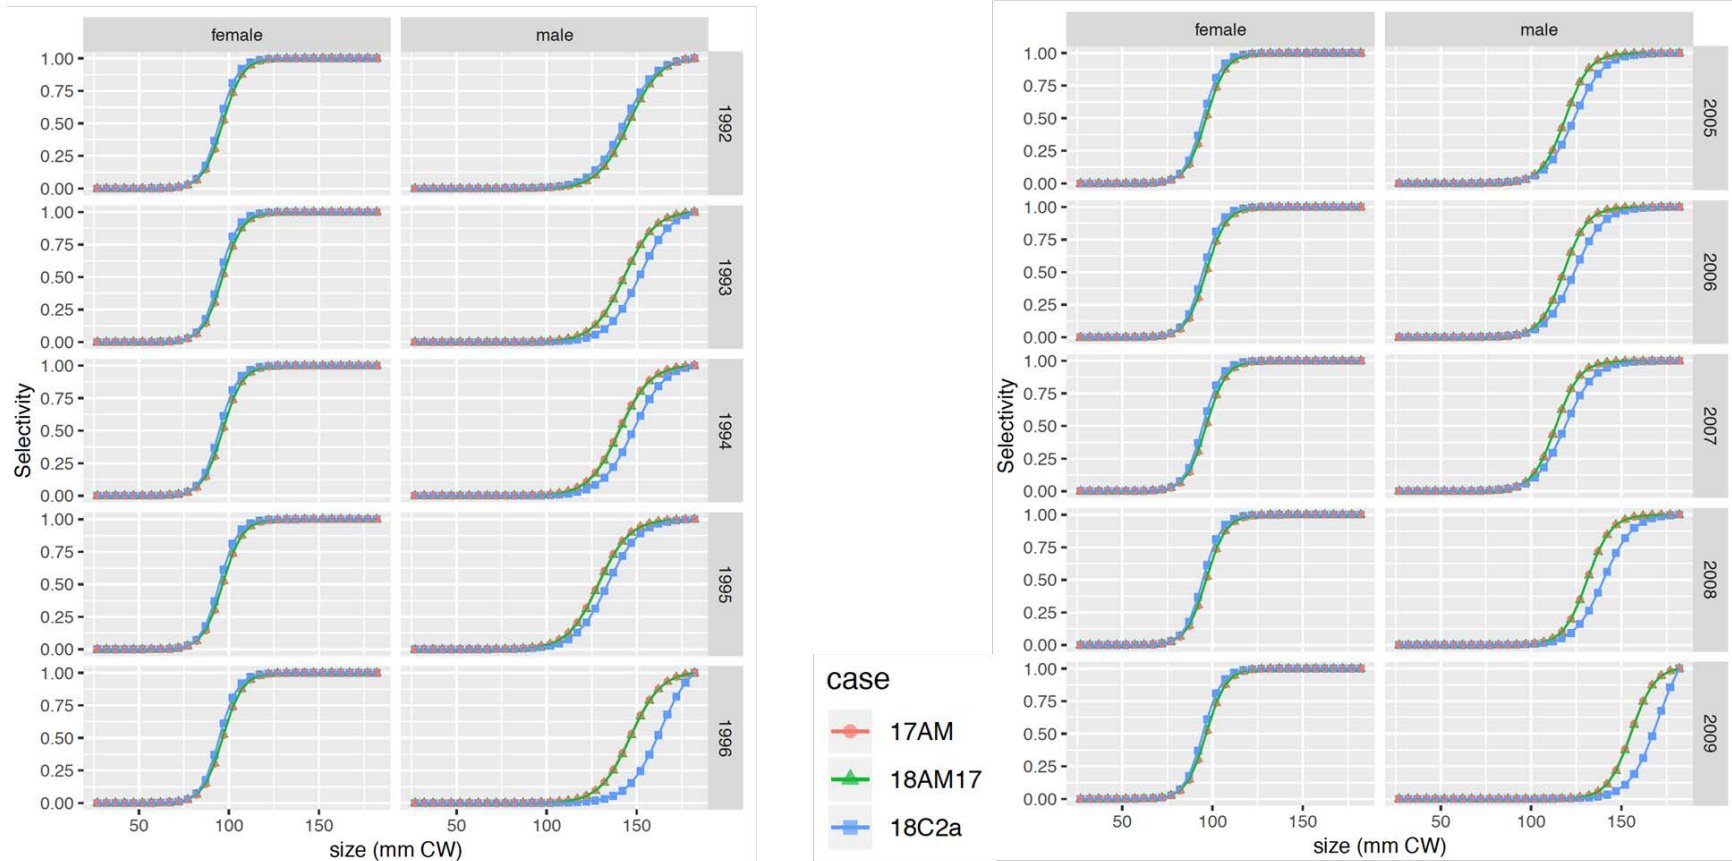

Figure 6. Comparison of estimated selectivity in the directed fishery from the CPT's recommended scenario (18AM17), the 2017 assessment model (17AM), and the author's preferred scenario (18C2a).

Fishery Total Bycatch Selectivities

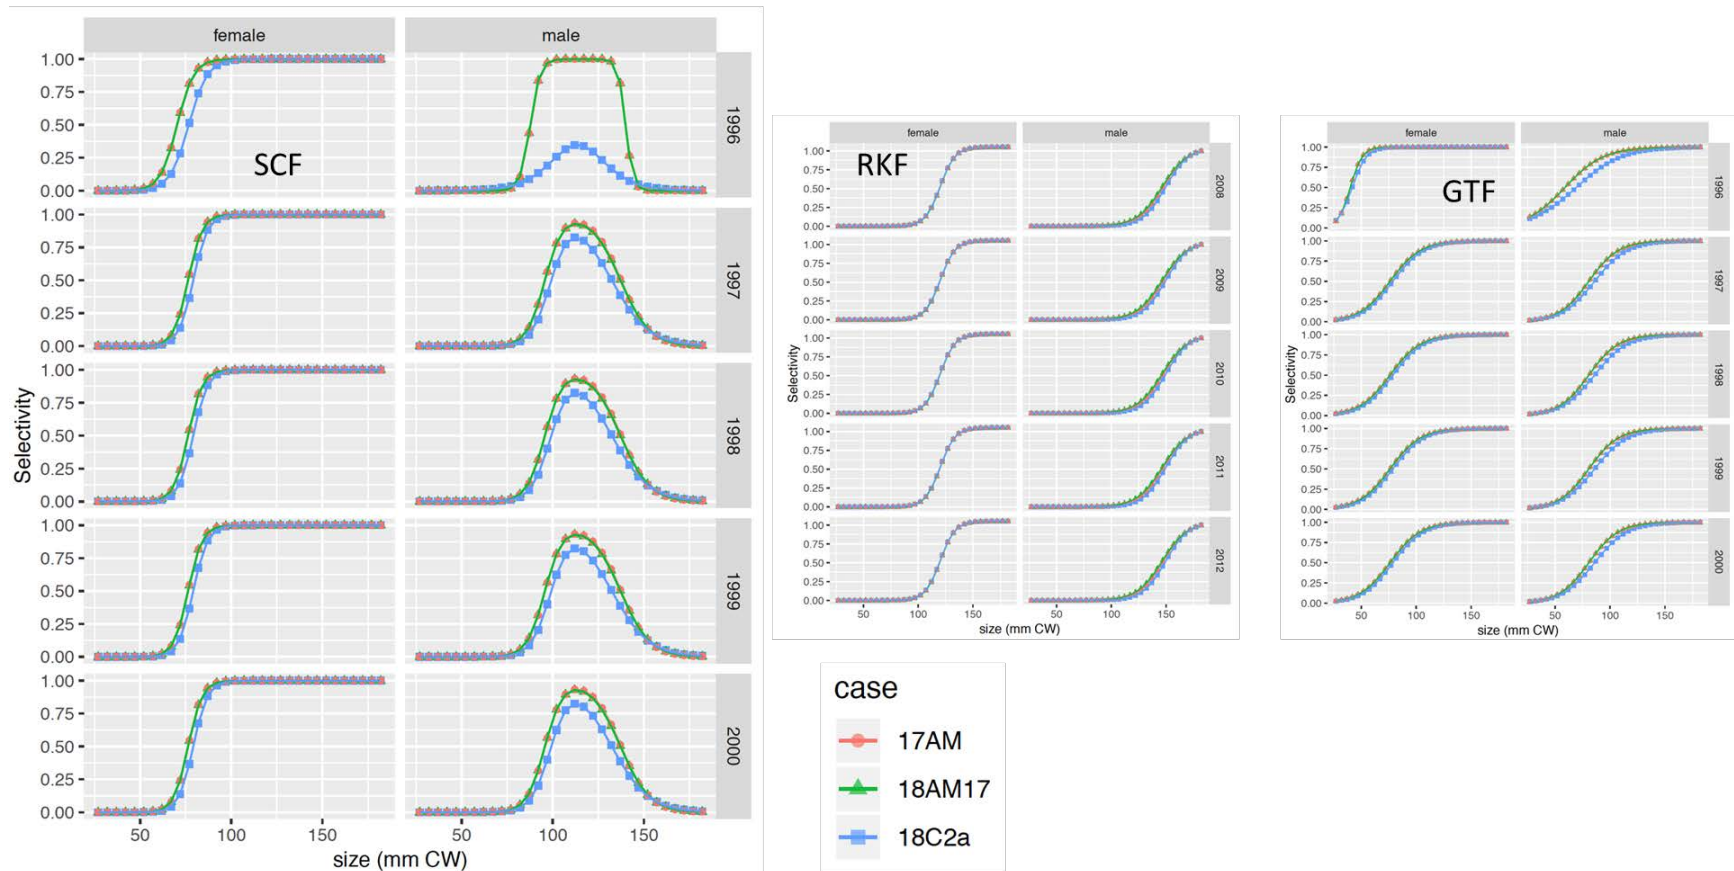

Figure 7. Comparison of estimated selectivities in the bycatch fisheries from the CPT's recommended scenario (18AM17), the 2017 assessment model (17AM), and the author's preferred scenario (18C2a).

Fits to survey biomass

Figure 8. Comparison of fits to survey biomass from the CPT's recommended scenario (18AM17), the 2017 assessment model (17AM), and the author's preferred scenario (18C2a).

Male catch in the directed fishery

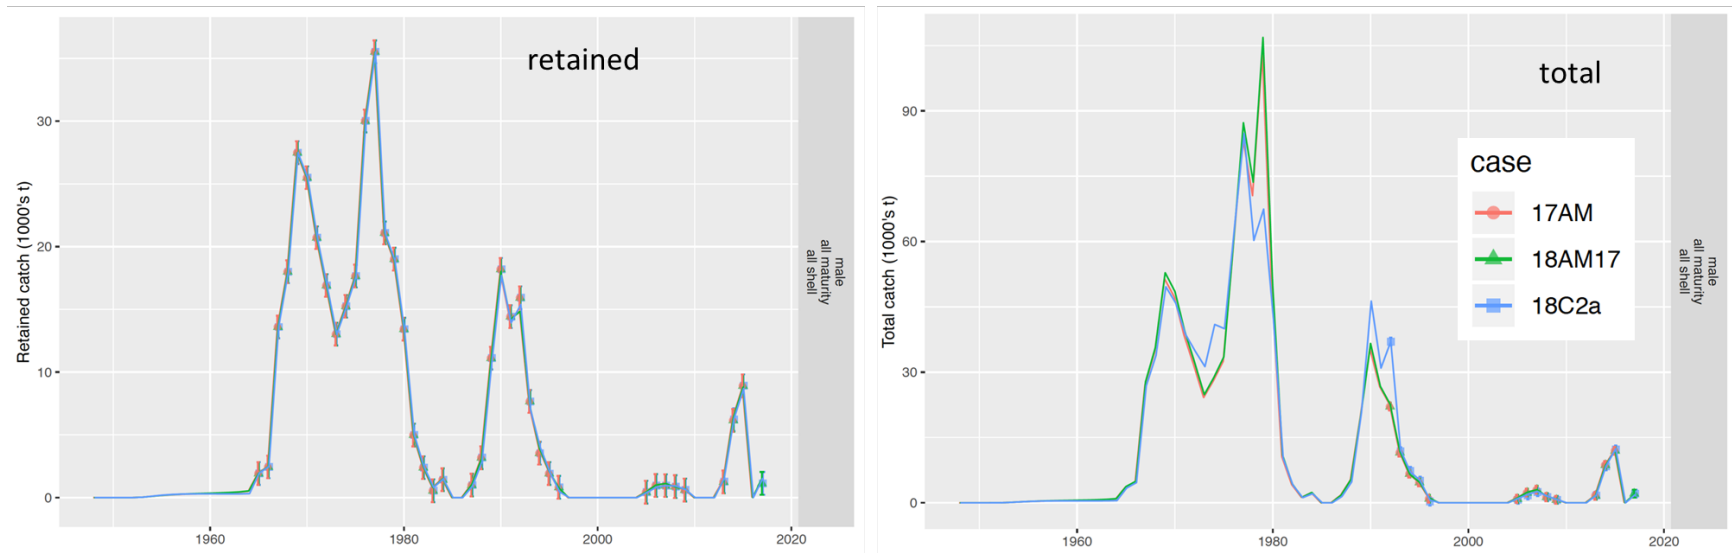

Figure 9. Comparison of fits to male catch biomass in the directed fishery from the CPT's recommended scenario (18AM17), the 2017 assessment model (17AM), and the author's preferred scenario (18C2a).

Fits to total male catch in bycatch fisheries

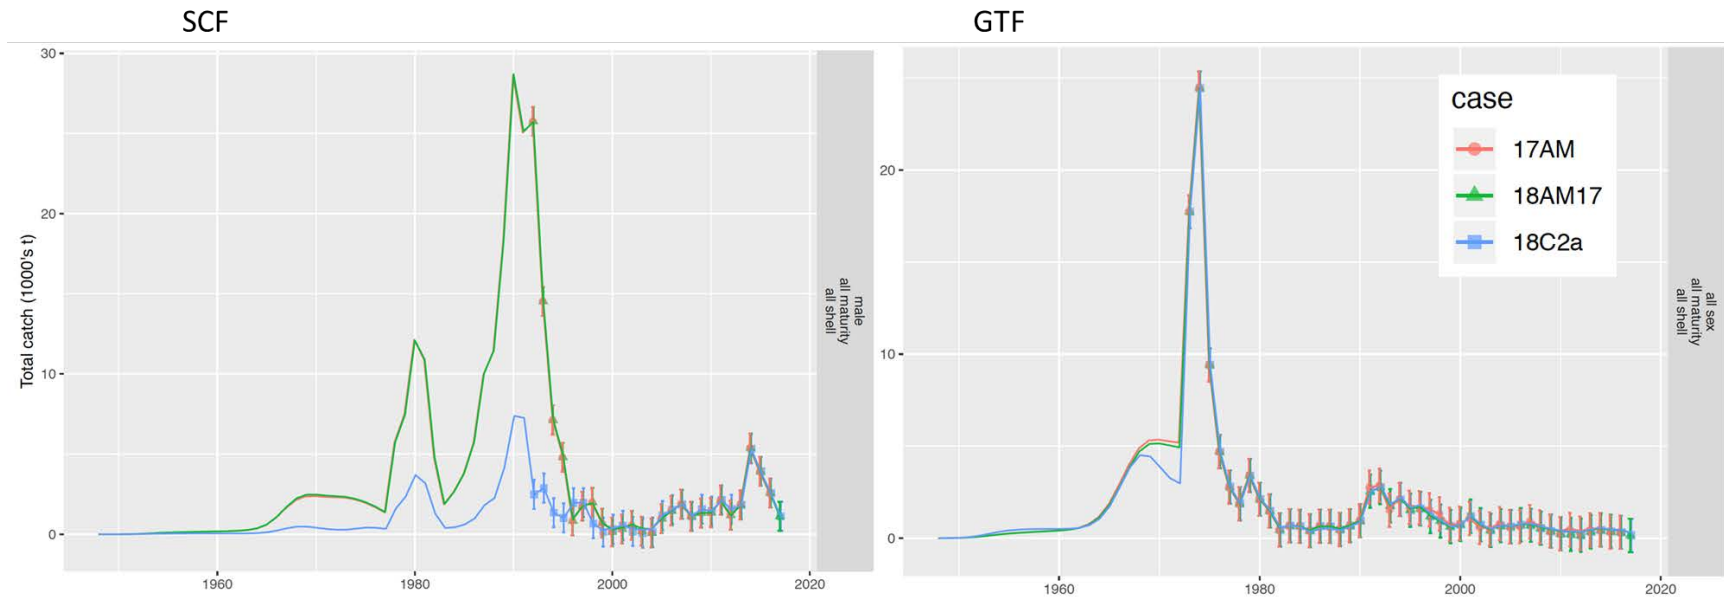

Figure 10. Comparison of fits to total male bycatch in the snow crab and groundfish fisheries from the CPT's recommended scenario (18AM17), the 2017 assessment model (17AM), and the author's preferred scenario (18C2a).

Fits to total male catch in bycatch fisheries

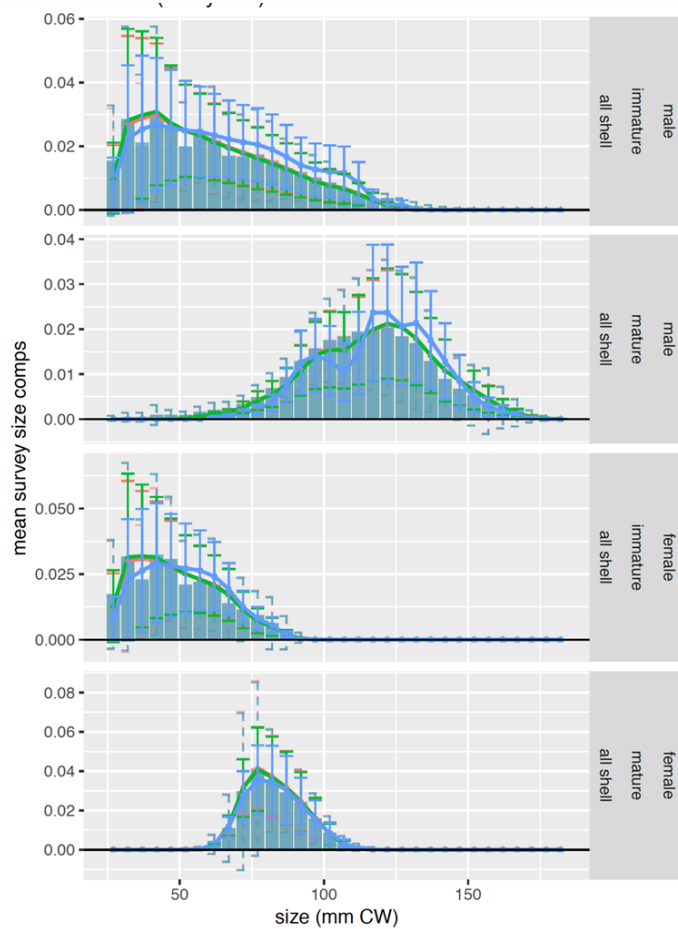

Figure 11. Comparison of fits to total male bycatch in the BBRKC fishery from the CPT's recommended scenario (18AM17), the 2017 assessment model (17AM), and the author's preferred scenario (18C2a).

Survey Size Comps

case

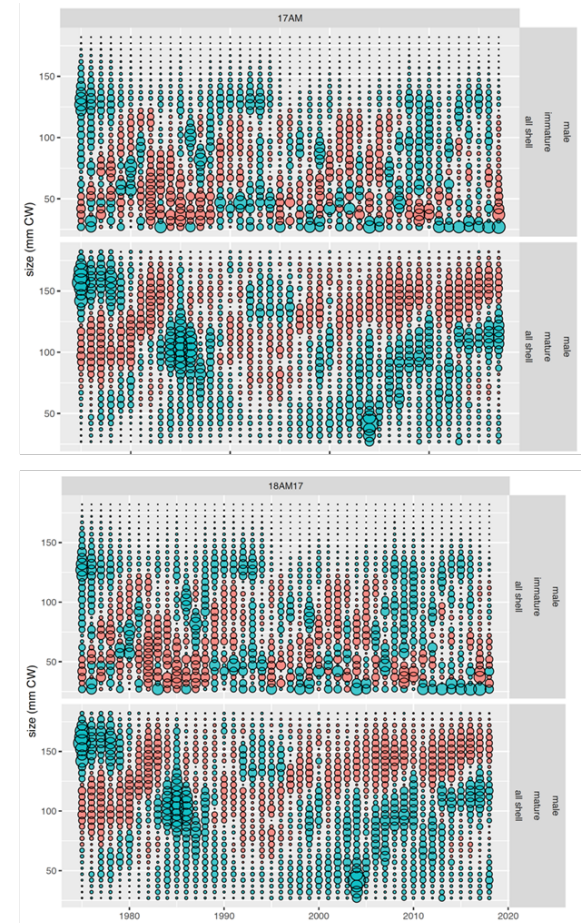

Figure 12. Comparison of mean fits to survey size compositions and residuals from the CPT's recommended scenario (18AM17), the 2017 assessment model (17AM), and the author's preferred scenario (18C2a).

Fishery Size Compositions

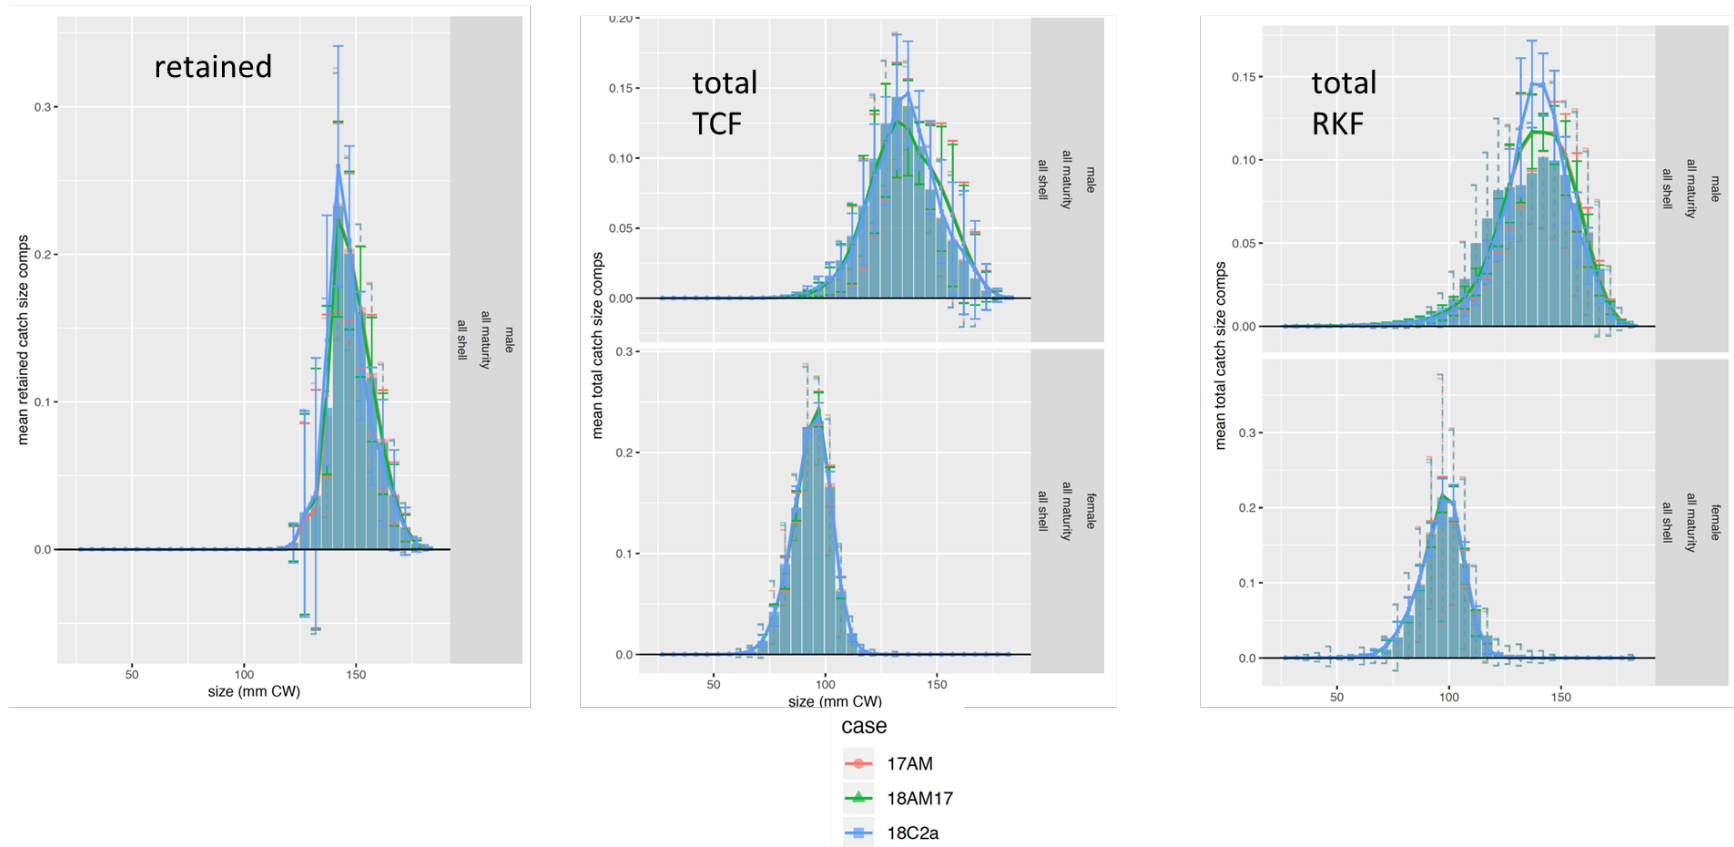

Figure 13. Comparison of mean fits to fishery size compositions from the CPT's recommended scenario (18AM17), the 2017 assessment model (17AM), and the author's preferred scenario (18C2a).

Fishery Size Compositions

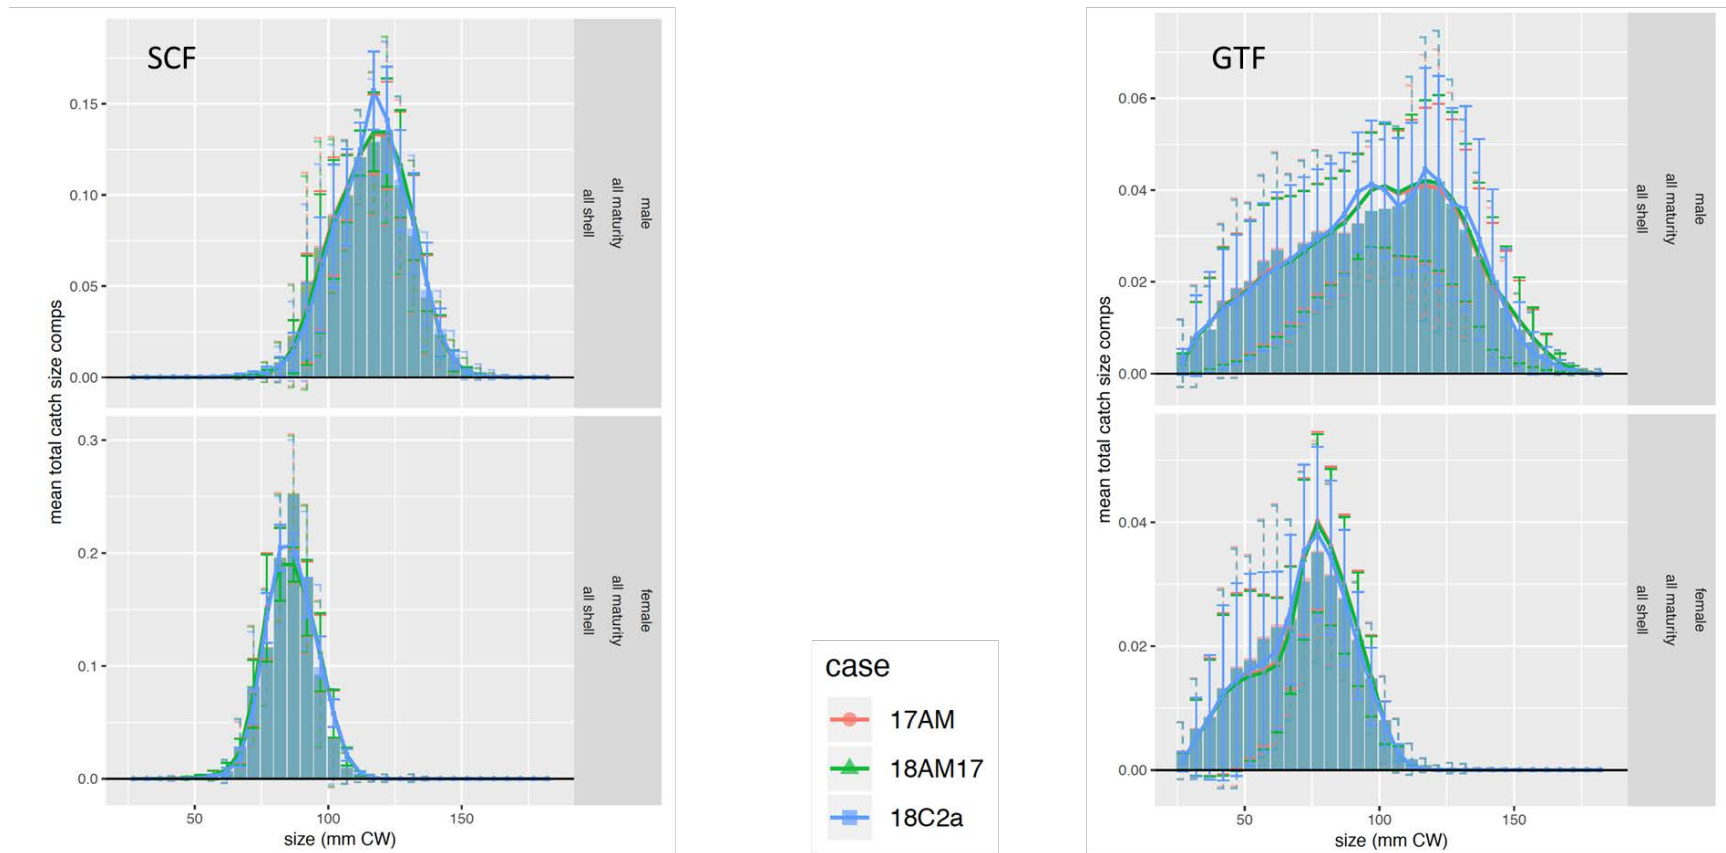

Figure 14. Comparison of mean fits to fishery size compositions from the CPT's recommended scenario (18AM17), the 2017 assessment model (17AM), and the author's preferred scenario (18C2a).
